

# IQAROS AGRO

## Remote temperature monitoring

### IQAROS wireless system

[www.iqaros.eu](http://www.iqaros.eu)

The set is **ready** from production, sensors on a **1.5m stainless steel stick** are adapted to measuring the **temperature** in the **hay, straw, dried grain**, etc. You just place them in places you want to monitor, set up thresholds, and contact information in an intuitive environment. If the thresholds are exceeded, you will receive an e-mail **alert** immediately. You can receive summary **reports** on a daily and weekly basis.

The sensors work on a **battery** - the manufacturer guarantees min. **7 years** lifetime in compliance with operating conditions.

The set includes an infrastructure - a repeater and an IoT gateway, which ensures the delivery of information from the sensors to the central application.

In remote locations, the connection can be provided using a **GSM** gateway, which is a part of the IQAROS wireless system. You can also connect the system to your local computer network with an **Ethernet** cable and save data transfer fees on the mobile operator's network.

**Temperature sensor**

**Repeater**

**IoT gateway**
